

Exercise 2.3 - AWS IoT SDK

In this exercise, you will build a chat application between car1 and car2 so they can send messages to each other. There is already a piece of code written that asks for data on the command line indefinitely. You will need to implement the publishing of the messages and the subscription to the right IoT Topic.

To implement this, you will use 2 IoT Topics: `lab/messaging/car1` and `lab/messaging/car2`. Car1 will subscribe to its IoT Topic (`lab/messaging/car1`) while car2 will subscribe to its own. Car1 will publish messages that it receives via command line to car2's IoT Topic while car2 will publish messages to car1's IoT Topic. They will be able to communicate with each other this way.

The diagram below shows the resources and data flow that you will create in this exercise.

As coding is required for this exercise, you have the choice to use NodeJS or Python. The full solution is provided as option if you don't want to code and prefer to just run the code. However, if you do use the solution, it is important to read it to understand what was done to solve this use case.

The [documentation of the AWS IoT Device SDK for JavaScript](#) is a great place for examples on how to do the tasks required. There are different examples to look at in the *examples* folder. That SDK is a wrapper for the [MQTT library for JavaScript](#) which is also another great place to look for help.

If instead you prefer to use Python, the [GitHub page of the AWS IoT Device SDK for Python](#) is a great place for examples on how to do the tasks required. There are different examples to look at in the *samples* folder. You can find the [documentation of the SDK linked on that page](#).

This exercise assumes that the resources from Exercise 1.1 haven't been deleted. If you have deleted those components, you will need to start with Exercise 1.1 again before continuing.

You have to make a choice of either doing this lab in NodeJS or Python. **Expand** one of the two sections below.

- ▶ Expand me to code in NodeJS.
- ▶ Expand me to code in Python.
